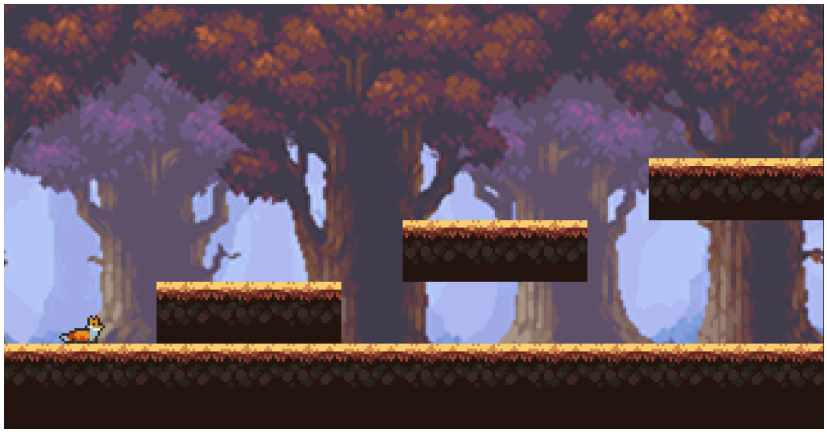
Process & Decision Documentation

GBDA 302 | Side Quest 9 | Katelyn Nguyen

Project/Assignment Decisions

For this side quest, using the example 3 as a starting point, I changed the layout level by adding in more tiles, and made a debug menu which allows players to toggle on/off the moon gravity and/or the hitboxes. Additionally, within the debug menu there are coordinates for the player to see how quick the fox is moving horizontally and vertically & I included another level with different tile arrangements for variety.



Surprisingly, the most challenging part of this assignment was displaying the instructions to access the debug menu. I tried to format the instructions within draw() simply using the text() function but no matter what I added or changed with the properties, no changes would reflect in Live Server. Eventually, I decided to try displaying the text within index.html and there was a slight improvement. Now, the text appeared but it wasn't contrasting enough to be visible and blended in too much with the background. Again, a similar problem arose, when I attempted to change the text colour, size, or even the background, nothing would change. This became slightly frustrating because I didn't think adding text would pose any difficulty. I soon realized that changing properties within the style.css file wouldn't help and solved this issue by directly tinkering with the properties within the index.html file.

```
<div
  id="game-instructions"
  style="
    position: fixed;
    bottom: 0;
    left: 0;        You, 4 hours ago • Uncommitted changes
    width: 100%;
    padding: 20px 0;
    text-align: center;
    font-family: monospace;
    font-size: 24px;
    font-weight: bold;
    color: yellow;
    background: rgba(0, 0, 0, 0.9);
    z-index: 999999;
  "
>
  Press M to open debug menu • Press L to switch levels
</div>
```

(Level 1)

(Level 2)

Side Quest 9

Name: Katelyn Nguyen

Role(s): Code modifier / Designer

Primary responsibility for this work: Add in additional features like debug screen with toggleable options, text, and change tile layout of level.

Goal of Work Session

- Make debug screen with options to toggle on/off moon gravity and hitboxes
- Adjusted Level 1 tile layout and added in a new level with different tile arrangement
- Make sure world behaved appropriately and consistently with correct player movement

Tools, Resources, or Inputs Used

- Example 3 from Week 9 code examples
- Microsoft Copilot
- Week 9 - Part 2 lecture slides

GenAI Documentation

Date Used: March 23, 2026

Tool Disclosure: Microsoft Copilot

Purpose of Use: Debugging issues, clarifying code behaviour, brainstorming solutions for any errors, and understanding toggle functions and level layout.

Summary of Interaction: The tool helped create a menu, implement features, deal with issues, and compare different approaches.

Human Decision Point(s): I rejected any approaches that seemed overly complex or seemed to add more confusion. I relied on my judgement and the lecture slide to decide what code to include or advice to use or deny.

Integrity & Verification Note: I primarily tested each change in Live Server, checking if any line of code added helped or conflicted. I also periodically checked that GitHub Pages updates were working properly.

Scope of GenAI Use: Any generated code I made sure to review, making changes manually and adapted suggestions to fit my project.

Limitations or Misfires: Sometimes the tool suggested more complex approaches than I needed, so I simplified them to match my direction and the assignment scope.

Summary of Process (Human + Tool)

- Broke down the side quest into step-by-step pieces
- Clarified questions and confusions points
- Offered approaches to fix errors and implement changes
- Properly reviewed that changes were being reflected

Decision Points & Trade-offs

Describe one or two key decisions you made:

- Adding in an additional level for game variety
- Including instructions on how to access the debug menu for clarify

Verification & Judgement

- Playtesting to ensure functionality through Live Server
    - Confirming the debug menu properly “opens/closes” when the user presses the M key
    - Making sure other key options also work properly when pressed
- Reviewing the side quest prompt/instructions

Limitations, Dead Ends, or Open Questions

- At times GitHub Pages didn’t update, which made me think it was a coding issue when it was actually a caching issue
- Briefly explored other features to add to the debug menu but wanted to keep it simple for this exercise, would additional features make the game more interesting to interact with or complicated?
